HEMODIALYSIS NEEDLE

The needle is made of special steel alloy that ensures exceptional smoothness of its surface. Thin walls and a triple – grinded spike punctures the fistula delicately and precisely. The surface of the needle is covered with silicone and therefore it goes through the tissues easily and well tolerated in the vessel. Specially shaped wings hold the needle easily and allow easy hanging. Moving wings make it easy to attach the needle to the skin - the position of the butterfly – nut can be changed without turning the needle in the vessel. The clamps that are easy to fasten and reliable in action are colored according to the line concerned: blue in the case of venous needles, red in the case of arterial needles, that allows easy application and prevents mistakes.
